## CHAPTER I

### INTRODUCTION

The purpose of this report is to summarize a complicated set of projections of the impact on Imperial Valley's economy of anticipated increase in crossborder truck traffic at the Calexico Port of Entry from the 1994 level (176,825 truck crossings per year) to a projected level of 2,000 truck crossings a day - 730,000 truck crossings per year.

Estimates of the increase in employment directly related to increase in crossborder truck activity is predicated on an analysis of employment change by specific employment category in Ports of Entry communities with extensive crossborder truck traffic. The same procedure was employed to estimate the potential increase in demand for developed industrial and commercial facilities related solely to increased crossborder truck traffic. These primary economic effects induce secondary growth in employment and population as a result of the introduction of new payrolls (created from outside the local economy) which recirculate within Imperial Valley's economy, creating new jobs in retailing, government, services, etc.

Calculation of the economic multiplier effect in Imperial Valley is complicated by several unusual structural characteristics of the Valley's economy - the considerable prison population, for example, has little impact on the retail sector. It affects the local economy through the vehicle of correctional officers' salaries which are a conduit to introduce funds into Imperial Valley's economy.

The retirement sector in Imperial Valley is an important economic base element. Retirees also have a primary economic impact on Imperial Valley's economy. Expenditures of retirement incomes (derived from outside the local economy) support

local jobs which in turn have a further economic multiplier effect as the newly employed local residents make local expenditures, etc., etc.

In order to calculate the economic multiplier applicable solely to expanded operations of the Port of Entry, it was necessary also to isolate economic multipliers applicable to the prison operation as well as the economic multiplier implicit in Imperial Valley's retirement population.

## CHAPTER II

### SUMMARY AND CONCLUSIONS

1. Projected increase in annual level of crossborder truck activity from the 1994 level of 176,825 truck crossings to 730,000 truck crossings per year is projected to have a significant impact on Imperial Valley's population, employment base, housing inventory, retail sector, and overall economic environment.
2. A projected 6,350 new jobs are anticipated to result directly from commercial activity at the Port of Entry with the attainment of 730,000 truck crossings per year. These jobs, along with the additional local jobs that will be induced by the payroll effects of the job base related to the Port of Entry, will add a total of 12,680 nonagricultural wage and salary jobs to Imperial Valley's total employment base, supporting a population increase of approximately 33,995 new residents.
3. The implications of these economic effects is summarized as follows:

**Assumption:**

Increase in annual crossborder truck traffic from 176,825 a year in 1994 to 730,000 a year at the horizon planning date.

**Primary Impact:**

Demand for 4.26 million square feet of new industrial floor area, 245 to 310 acres of new industrial development.

Demand for development of 65 acres for new commercial facilities.

Increase employment of 6,350 jobs.

Increase annual payroll (1994 prices) of \$205,930,500

**Total Impact - Primary and Induced:**

Employment (Permanent)	12,680 Jobs
Population	33,995

**Construction:**

Primary:

Industrial	4.26 Million Sq. Ft.
Commercial	65.0 Acres

Secondary:

Housing Including Vacant	9,300 to 9,700 D.U.
Retail	1.10-1.34 Million Sq. Ft.
Other Commercial	0.4 Million Sq. Ft.

Increased In-Store Taxable Retail Sales	\$175 to 186 Million Per Year in 1994 Prices
Construction Employment	23,386 Job Years

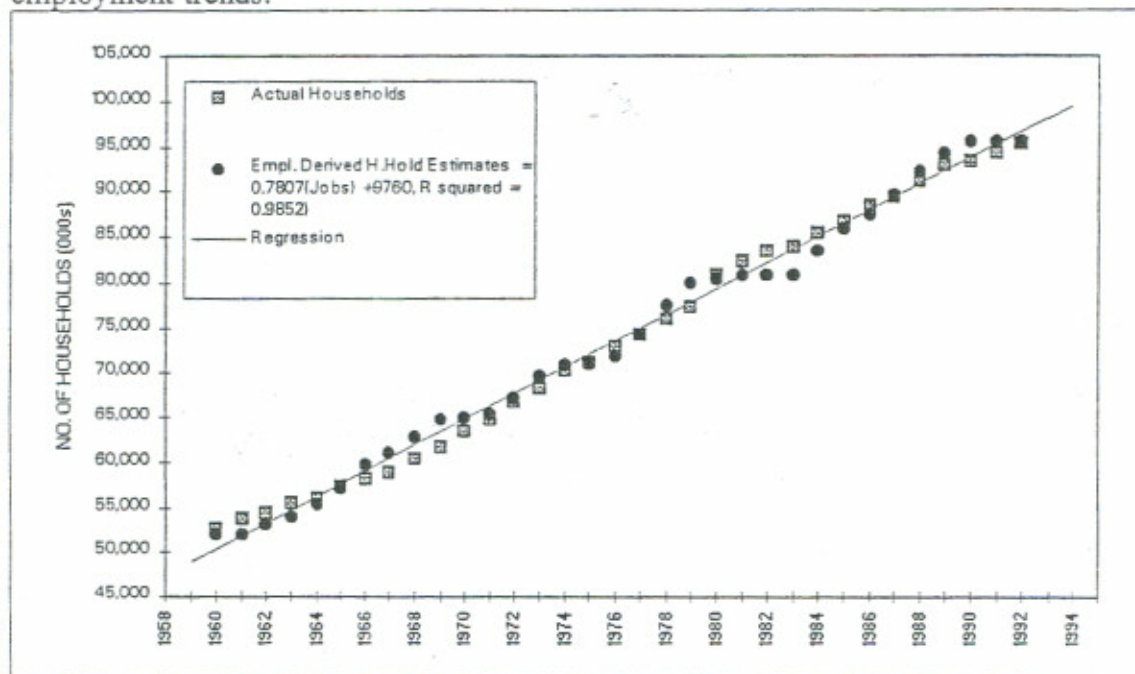

## CHAPTER III

### IMPERIAL COUNTY POPULATION, HOUSING, EMPLOYMENT AND ECONOMIC BACKGROUND

#### HOUSING DEMAND

##### General Applications

Statistical analyses of housing demand relative to economic growth are based largely on employment data. The correlation analysis illustrated below defines a close relationship between actual U.S. household formation and statistical estimates of the number of U.S. households based on national nonagricultural wage and salary employment trends:

The simple linear equation described above has effectively simulated the number of U.S. households over a 32-year period with an  $R^2$  coefficient of 0.9852. During periods of economic growth, employment-based estimates of potential households typically lead actual U.S. household levels by one or more years, suggesting that the

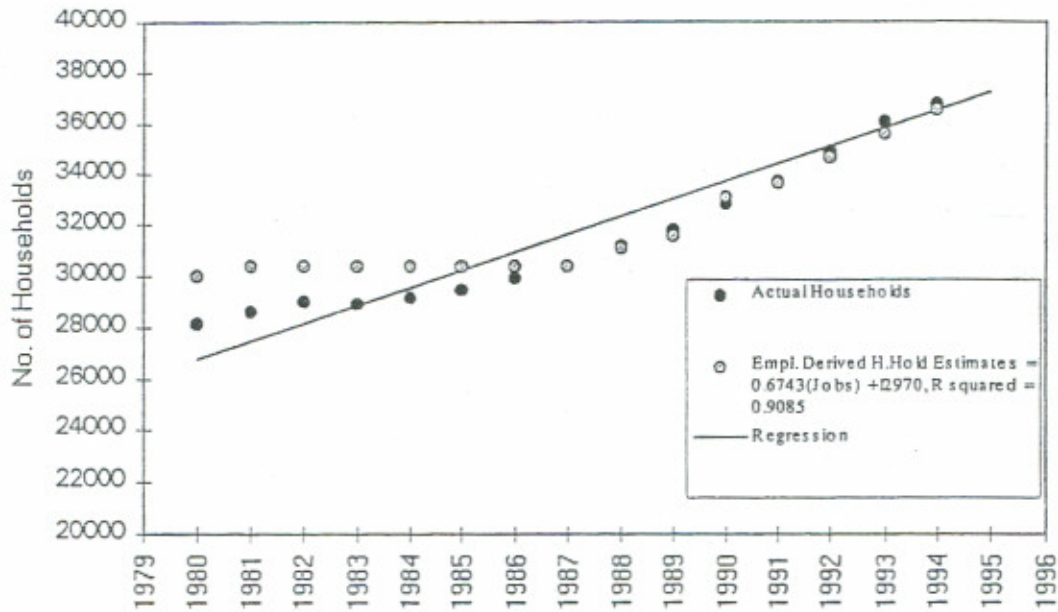

exceptionally close statistical relationship between employment and household formation is an effective basis for evaluating demand for housing.

Employment data are available in several formats from a variety of sources. The definition of employment that best correlates with households is nonagricultural wage and salary jobs. The large component of agriculture jobs in Imperial Valley, however, requires special treatment of these employment and household interrelationships. An alternate concept of employment (based on self-reported employment data collected as part of the Census process every ten years) is useful in tracing trends and also (in this instance) dealing with the ambiguity of agricultural employment in Imperial Valley. This broader Census definition of employment has not, however, correlated with household formation as effectively as the nonagricultural wage and salary employment time series data available from State agencies and the U.S. Department of Labor. In order to overcome this limitation, it was necessary to meld the two basic sources of employment data into a specific time series employment definition.

#### **Imperial Valley Applications**

Nonetheless, estimates of the number of households in Imperial Valley based only on nonagricultural wage and salary employment levels have replicated the actual number of households in Imperial Valley fairly accurately as illustrated by the following graphic comparison of the actual number of households in Imperial Valley relative to estimates based only on nonagricultural wage and salary employment:

A more finite definition of the relationship between employment and households in the context of the substantial, and until recently, increasing proportion of retired households in Imperial Valley is discussed in a subsequent section of this chapter.

### IMPERIAL COUNTY, CA SOCIO-ECONOMIC, POPULATION, AND HOUSING CHARACTERISTICS

Exhibits III-1 and III-2 summarize the key socio-demographic data for Imperial County from the 1980 and 1990 Censuses. Exhibit III-3 compares the profile of Imperial County's housing in 1990 with the characteristics of the housing stock ten years earlier.

#### Changing Socio-Economic Conditions

Between 1980 and 1990, median value of owner-occupied housing in Imperial Valley increased at a slightly slower percentage rate than median household income as shown below:

	1980 Census	1990 Census	Change	Annual Growth Rate
Median Housing Value	\$47,841	\$72,528	\$24,687	4.25%
Median Household Income	\$14,749	\$22,442	\$7,693	4.29%
Value-to-Income Ratio	3.24	3.23	3.21	-

A comparison of change in employed population in Imperial Valley between 1980 and 1990 with change in the number of households shows the number of employed persons per household declined as follows:

	1980 Census	1990 Census	Change
Total Number of Workers	33,778	36,613	2,835
Total Number of Households	28,157	32,842	4,685
Workers Per Household	1.20	1.11	0.61

The decline in jobs per household was primarily the result of a fairly large increase in the proportion of Imperial Valley's population age 65 and over during the 1980's decade. The following tabulation illustrates the level of employed population in Imperial Valley relative to the number of households in which the head of household is less than 65 years old (mainstream households).

	1980 Census	1990 Census
Total Households	28,157	32,842
Households With Head of Household 65 and Over	5,541	7,389
Employed Population	33,778	36,613
Non 65+ Households	22,616	25,453
Employed Persons Per Non 65+ Household	1.49	1.44

In 1980, 8,330 residents of Imperial Valley were age 65 or over - 9.15 percent of the non-institutionalized population. By 1990, 11,108 residents were age 65 or over representing 10.39 percent of the non-institutionalized population in the Valley. The non-institutionalized population of the Valley increased by 15,802 persons. People age 65 or over represented 17.6 percent of this population growth (16.2 percent of population growth including residents of group quarters) and 39.4 percent of net increase in households. The key ratio illustrated above is the relationship between the

employed population of the Valley and the number of households that were not headed by someone age 65 or over (mainstream households).

This ratio declined from 1.49 employed persons per household in 1980 to 1.44 per household in 1990. Projection of continued decline in this ratio is a basis for converting employment projections to projections of housing demand.

**Changing Population Characteristics**

The age profile of Imperial Valley's population (including institutionalized residents of the County) at the date of the two Census is illustrated in the following pie charts:

1980 POPULATION DISTRIBUTION BY AGE

1990 POPULATION DISTRIBUTION BY AGE

These comparisons are made more explicit (total population including those living in group quarters) in the following tabulation:

	1980		1990		Change	
	Number	Percent	Number	Percent	Number	Percent
Age 0 to 19	35,895	39.0%	41,098	37.6%	5,203	30.3%
Age 20 to 34	21,522	23.4%	24,304	22.2%	2,782	16.2%
Age 35 to 54	18,359	19.9%	23,907	21.9%	5,548	32.3%
Age 55 to 64	8,004	8.7%	8,886	8.1%	882	5.1%
Age 65 & Over	8,330	9.0%	11,108	10.2%	2,778	16.2%
Total	92,110	100.0%	109,303	100.0%	17,193	100.0%

While the total population increased by 17,193 persons, the non-institutional or household population increased by 15,802 - 8.1 percent of population growth over this period was people living in group quarters.

A similar graphic comparison of change in the ethnic composition of Imperial Valley's population between the dates of the two Censuses is shown below:

1980 POPULATION DISTRIBUTION BY RACE

1990 POPULATION DISTRIBUTION BY RACE

As indicated above, Hispanics accounted for all of the population growth on a net basis in Imperial Valley between the dates of the two Censuses. This trend is expressed more explicitly in the following tabulation:

	1980		1990		Change	
	Number	Percent	Number	Percent	Number	Percent
Non-Hispanic White	35,411	38.4%	31,742	29.0%	-3,669	-21.3%
Hispanic	51,384	55.8%	71,935	65.8%	20,551	119.5%
Black	2,188	2.4%	2,272	2.1%	84	0.5%
Asian/Pacific Islander	1,178	1.3%	1,632	1.5%	454	2.6%
American Indian	1,024	1.1%	1,563	1.4%	539	3.1%
Other	925	1.0%	159	0.1%	-766	-4.5%
Total	92,110	100.0%	109,303	100.0%	17,193	100.0%

### Housing and Household Size Characteristics

Vacant housing became a decreasing proportion of the Valley's total housing stock during the decade of the 1980s as shown below:

1980 DISTRIBUTION OF HOUSING UNITS

1990 DISTRIBUTION OF HOUSING UNITS

The ratio of homeownership among permanent residents of Imperial Valley declined during the 1980s. In 1990, 57.6 percent of Imperial Valley's households were homeowners. Nationwide at that time, 64.2 percent of all households were homeowners. Despite the low cost of housing in Imperial Valley and the modest rate of increase in value, the homeownership ratio declined from 1980 to 1990.

Change in Imperial Valley's housing inventory between 1980 and 1990 summarized from Exhibits III-1 and III-2 was as follows:

	Dwelling Units		Average Annual
	1980	1990	Change
Detached	18,551	20,458	191
Attached	8,539	8,719	18
Mobile Homes & Other	<u>3,749</u>	<u>7,382</u>	<u>363</u>
Total	30,839	36,559	572
Total Stick-Built			209

Housing tenure patterns in the Valley in 1980 and 1990 were as follows:

	1980		1990		Change	
	Number	Percent	Number	Percent	Number	Percent
Owner-Occupied	16,993	60.4%	18,907	57.6%	1,914	40.9%
Renter-Occupied	<u>11,164</u>	<u>39.6%</u>	<u>13,935</u>	<u>42.4%</u>	<u>2,771</u>	<u>59.1%</u>
Total Occupied	28,157	100.0%	32,842	100.0%	4,685	100.0%

Exhibit III-3 summarizes change in population, housing stock, tenure patterns, etc., for Imperial Valley between the 1980 and 1990 Census. Exhibit III-4 includes

year-by-year estimates of Imperial Valley's population provided by the California State Department of Finance. As can be seen in Exhibit III-4 and illustrated graphically in Exhibit III-5, Imperial County's population growth increased after 1990 - especially after 1991. This reflects the impact on local jobs and population of the opening of new prison facilities after 1991. Calipatria's population became an increased percentage of Imperial Valley population after 1991. The City of Imperial also accounted for an increasing proportion of the County's population base. Much of the Valley's population increase since 1990 has been related to increase in the inmate population which has virtually no direct impact on the economy (retail sales, housing demand, etc.) except secondarily through employment of correction officers which does affect the local economy.

## EMPLOYMENT TRENDS

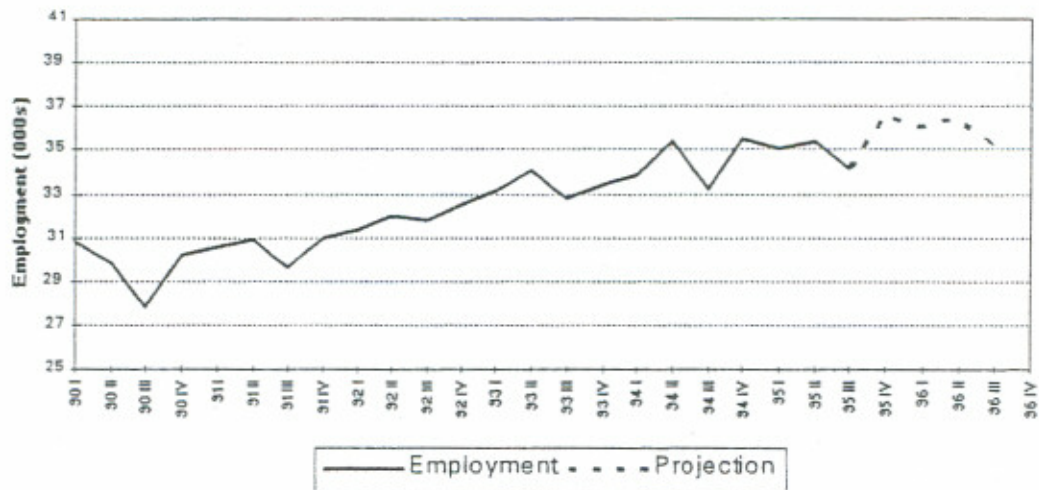

### Historical and Anticipated Employment Trends

Because employment data are reported on a monthly basis by the Employment Development Department (EDD) in the State of California, this source of employment data is used most frequently as input to economic analyses. As noted in the introduction of this chapter, however, Imperial Valley's employment structure is unique in terms of a large component of relatively volatile agricultural employment, much of which staffed by nonresident workers of Mexicali. For example, as shown in Exhibit III-6, the EDD reported 42,000 jobs in Imperial Valley in 1980. As noted above, however, the 1980 Census found only 33,778 residents of Imperial Valley were employed. By 1990, the Employment Development Department of the State of California reported 44,800 jobs in Imperial Valley. At that time, the Census found 36,613 local residents employed (including agricultural workers). Over this interval, the number of local residents who identified themselves as being employed in agriculture increased only marginally - from 4,935 farm workers in 1980 to 4,985 farm

workers in 1990 - while at the same time the number of agricultural jobs in the Valley decreased from 16,725 to 15,000. Over 11,000 agricultural jobs in Imperial Valley were not directly tied to local residents. Volatility of employment levels in agriculture in the Valley, therefore, appear to have relatively little impact on the number of employed residents of the Valley - the differences being absorbed by workers from Mexico.

This unique characteristic requires a special definition of employment that has significant implications for the local economy - nonagricultural wage and salary employment plus a core of local residents employed in agriculture -  $\pm 5,000$  local residents employed in the local agricultural enterprise.

The general trend of nonagricultural wage and salary employment (the key component of the most analytically useful definition of employment) has been as follows:

Recent changes in nonagricultural wage and salary employment in Imperial Valley are summarized below:

	1993	1994	1995	93-94 Change	94-95 Change
January	33,100	33,900	35,000	800	1,100
April	34,000	35,400	35,400	1,400	0
July	32,800	33,200	34,100	400	900
October	33,400	35,500	-	2,100	-
Jan. - Oct.	300	1,600	-		

Recently, nonagricultural wage and salary employment in the Valley has been fairly volatile.

### Breakdown of Employment by Type

The profile of nonagricultural wage and salary jobs in Imperial Valley and change in employment in this sector between September 1994 and September 1995 is summarized below:

Industry	09/94	09/95p	Percent Increase	Change 9/94-9/95p	
				Total	Percent
Mining	100	100	0.0%	0	0.0%
Construction	1,600	1,400	-12.5%	-200	100.0%
Manufacturing	1,800	1,800	0.0%	0	0.0%
Trans., Comm., Utilities	1,600	1,700	6.3%	100	-50.0%
Trade	9,700	9,500	-2.1%	-200	100.0%
Finance, Ins., Real Estate	1,100	1,100	0.0%	0	0.0%
Services	6,000	5,900	-1.7%	-100	50.0%
Government	<u>12,800</u>	<u>13,000</u>	1.6%	<u>200</u>	<u>-100.0%</u>
Total	34,700	34,500	-0.6%	-200	100.0%

The most volatile nonagricultural employment sectors are construction and trade. Construction employment in Imperial Valley is affected by initiation and completion of large projects ranging from a low of 1,050 jobs in 1982 to 2,500 jobs in 1991. The recent decline in trade employment is probably a manifestation of devaluation of the Peso. Continued growth in government jobs in part reflects the impact on the local job base of correctional institution employees which are included in the government sector. Government is a larger share of local nonagricultural employment in Imperial County than it is nationally - by more than double.

Industry	Nonagricultural Jobs September 1995		Percent Of United States
	Number	Percent	
Mining	100	0.3%	0.5%
Construction	1,400	4.1%	4.3%
Manufacturing	1,800	5.2%	15.9%
Trans, Comm, Utilities	1,700	4.9%	5.2%
Trade	9,500	27.5%	23.2%
Finance, Ins, Real Estate	1,100	3.2%	6.0%
Services	5,900	17.1%	28.0%
Government	<u>13,000</u>	<u>37.7%</u>	<u>16.8%</u>
Total	34,500	100.0%	100.0%

Government employment represents 16.8 percent of all nonagricultural wage and salary employment nationwide but 37.7 percent in Imperial Valley. Manufacturing is only 5.2 percent of Imperial Valley's nonagricultural wage and salary employment base. It is 15.9 percent of the U.S. employment base. Trade represents a larger proportion of nonagricultural wage and salary jobs in Imperial Valley than it does nationwide - in part due to crossover border traffic but also as a response to retired consumers who support jobs in the trade sector. Jobs in finance, insurance, and real estate as well as in the services are a relatively small proportion of the local nonagricultural wage and salary employment base. Imperial Valley's economy is not yet of sufficient scale to support home offices for banks, insurance companies, etc., nor is it past the threshold to support the full range of business services found in larger economies.

Trends in employment (jobs in Imperial Valley but not necessarily employed residents of Imperial Valley) are illustrated graphically in Exhibit III-7. Change in the occupational profile of employed local residents between 1980 and 1990 is summarized in Exhibit III-8, showing an increase in most white-collar occupations (except for clerical jobs) and increases in all blue-collar occupations - only a marginal increase, however, in farm worker residents of Imperial Valley.

The composition of Imperial Valley's job base (as distinct from the profile of employed Imperial Valley residents) is illustrated in Exhibit III-9. Government

increased from 21.0 percent of total local employment in 1990 to 27.0 percent in 1995 - a direct reflection of prison facilities. Agriculture is a smaller proportion of the job base in 1995 than it was in 1990 as is the case also with regard to mining and construction employment. Construction employment figures for 1990 and 1991 were influenced by the major construction projects underway at that time. Construction employment increased from 1,800 jobs in 1989 to 2,500 jobs in 1991, followed by a subsequent decline to 1,500 construction jobs in mid-1995.

### CONSTRUCTION TRENDS

Economic growth implies increased demand for housing, retail facilities, offices, government facilities, etc. The largest dollar volume of construction activity typically is in the residential sector. Residential development in Imperial Valley reflected in building permit activity has been volatile since 1990, as illustrated below:

Year	Building Permit Units			Building Permit Value Per Unit		
	Single Family	Multi-Family	Total	Single Family	Multi-Family	Total
1980	253	260	513	\$42,938	\$24,511	\$33,599
1981	160	166	326	49,539	27,510	38,322
1982	155	243	398	42,604	26,646	32,861
1983	245	66	311	49,920	38,920	47,586
1984	309	126	435	58,789	25,723	49,211
1985	311	121	432	61,245	39,833	55,248
1986	409	350	759	67,392	29,357	49,853
1987	314	108	422	62,793	28,883	54,115
1988	451	171	622	73,320	36,021	63,066
1989	474	297	771	78,425	35,218	61,781
1990	500	587	1,087	83,804	38,758	59,478
1991	672	165	837	88,210	34,537	77,629
1992	837	164	1,001	90,811	50,181	84,154
1993	528	99	627	99,231	42,485	90,271
1994	657	177	834	96,704	46,086	85,962
1/95 - 9/95p	281	64	345	94,459	49,125	86,049

From 1990 to 1994, an average of 877 new residential units a year was authorized by permit. Building permit activity for housing construction understates increase in housing inventory. It does not include mobile homes. Between 1980 and 1990, mobile homes increased from 11.7 percent of Imperial Valley's housing stock to

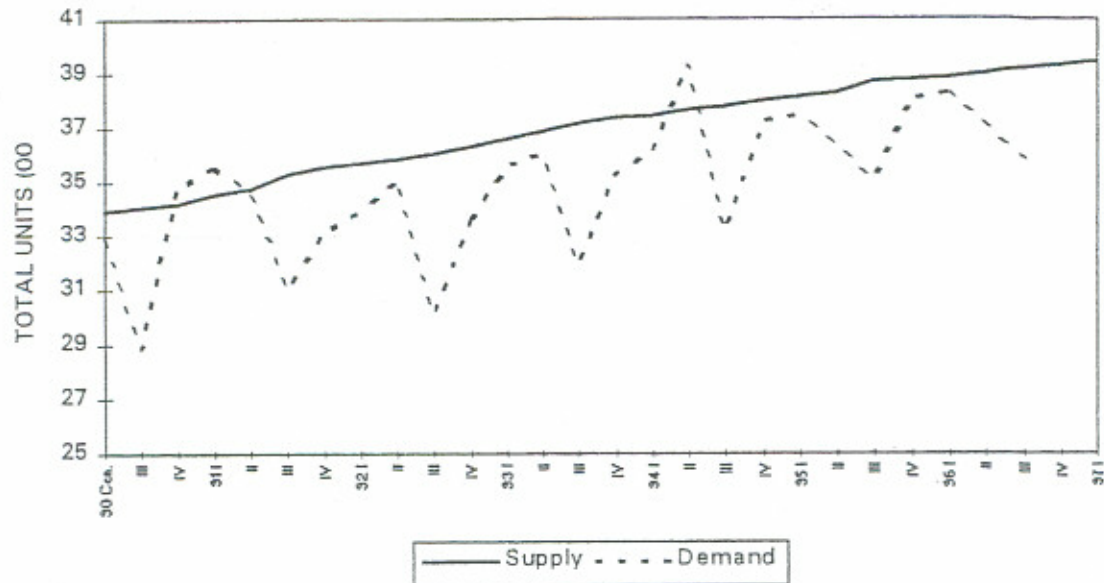

18.7 percent. Over the decade of the 1980s, an average of 499 new units of stick-built housing were authorized for construction each year. Net change in the housing inventory in Imperial Valley between 1980 and 1990 was considerably less than the combined impact of increase in mobile home units and the level of building permit activity. These two components imply increase in housing inventory at an average of 806 units a year. Net increase was an average of 572 units a year, suggesting demolitions, etc., removed an average of about 230 units a year of housing from Imperial Valley's housing stock.

Assuming mobile home units continued to represent 18.7 percent of the Valley's housing stock (as they did in 1990), the average of 877 new units a year authorized for construction in the Valley between 1990 and 1994 would have constituted average annual increase in housing inventory (assuming no significant additional demolitions) of 1,080 units a year. Retirees represented demand potential for about 230 units a year. Assuming an effective vacancy rate of 5.0 percent, mainstream housing market absorption was  $\pm 800$  units a year, implying economically effective employment of 1.37 jobs per occupied mainstream housing unit. This estimate is within 3.5 percent of the statistically projected ratio of jobs to mainstream housing occupancy for 1995.

## HISTORICAL AND ANTICIPATED SUPPLY AND DEMAND

### Simulated Supply and Demand Conditions

The Consultant's basic ongoing statistical system for estimating housing demand related to increase in employment produces the following comparison of estimated increase in demand relative to estimated increase in supply of housing in Imperial Valley since 1990:

These two trends have paralleled one another reasonably well except for seasonal volatility.

Exhibit III-10 is a summary of building permit activity in Imperial Valley from 1975 through Third Quarter 1995, showing that between 1975 and 1984 a substantial proportion of the permit value of new development in Imperial Valley was for new retail facilities - a response to consumer support for local retailers from residents of Mexico. From 1985 to 1989, industrial development was a large proportion of building permit activity - over 50.0 percent. Historically, office development has been a small proportion of new local construction activity. Since 1989, as reflected in the graph in Exhibit III-11, residential development has accounted for the largest share of new construction activity authorized by permit. This is expected to change as a result of increased demand for industrial facilities resulting from the projected increase in crossborder truck traffic from its 1994 level of about 175,000 crossings per year to a projection horizon of 730,000 crossings a year.

### BUILDING PERMIT TRENDS Imperial County, California

33

## CHAPTER IV

### OVERALL ECONOMIC IMPACT

This section of the report discusses the overall impact on Imperial Valley's economy of an expected increase in crossborder truck traffic at the Calexico Port of Entry from 176,825 crossings in 1994 to an estimated 2,000 truck crossings per day, or 730,000 truck crossings per year in the future - an increase of 553,175 truck crossings per year over an undefined time frame. In order to lend perspective to the potential for increase in truck crossings, the fastest growing Port of Entry surveyed is the Laredo Port of Entry, where between 1990 and 1994, increase in truck crossings was 114,147 per year.

#### Direct Economic Impact

Analysis of development of industrial and commercial facilities at other Ports of Entry coincident with increase in the level of annual truck crossings defined a conservative ratio of 7.7 square feet of new industrial development per unit increase in annual truck crossings. On this basis, increase of 553,175 truck crossings per year in Calexico would induce development of 4,259,500 square feet of new industrial floor space. At a floor area ratio (FAR) of 0.4 (40.0 percent lot coverage), 4.26 million square feet of industrial floor area represent absorption potential for development of 244.45 acres directly related to the anticipated increase in crossborder traffic.

Concurrently, increase in support activity primarily in the trade sector constitutes absorption potential for another 65 acres of commercial development directly responsive to the assumed increase in crossborder truck traffic - total development potential on these assumptions of  $\pm 310$  acres. Allowance for roads, streets, and other service facilities suggests absorption potential for approximately 385

acres as a result of an assumed increase in crossborder traffic from 176,825 crossings a year in 1994 to 730,000 truck crossings at a future date

This increase in crossborder activity will stimulate directly related employment of 11.45 new jobs per 1,000 of increase in annual truck crossings, or 6,334 jobs (rounded to 6,350 jobs) directly related to increased annual level of truck crossings.

In addition, the development of facilities to respond to increased crossborder truck activity at the Calexico Port of Entry is projected to generate 3,160 job years of construction jobs.

### **Induced Economic Effects**

The 6,350 new primary jobs directly related to increase in annual crossborder truck traffic will generate an increase in population. These new consumers will require second and tertiary increases in employment to provide a wide range of consumer goods and services. Increased scale of the consumer support base in Imperial Valley will induce new jobs in retailing, banking, personal services, auto repair, churches, entertainment, health services, legal services, charitable institutions, other professions, and government.

Total impact in terms of increased population and employment (allowing for the economic multiplier effect) stimulated by an expansion of demand for consumer services is estimated to be 12,680 jobs - 6,350 primary jobs and 6,330 induced jobs.

This level of increased employment is consistent with a concomitant new population of 34,995. The economic multiplier to be applied to the primary jobs in Imperial Valley (defined by the scale of its economy, the volatility of agricultural and construction employment, and the significant economic impact of retirees) is 1.997. Other estimates of the appropriate economic multiplier range from 1.94 to as much as 2.21; i.e., it could be argued that total increase in employment derivative of an increase of 6,350 primary jobs could be as much as 14,033 jobs, supporting population increase

of 37,623. Much recent population growth in Imperial County has not had a significant impact on retail and other types of consumer-related employment. Prison inmates are essentially isolated from most typical impact on the local economy except for correction employment related to the operations of the prison and some support services. Retirees, which are part of the consumer population but not part of the labor force, have a job inducement effect equivalent to about 0.17 local jobs per retired resident. These characteristics of Imperial Valley's unusual economic structure were taken into account in determining the appropriate employment multiplier in order to reflect only the effect on increase in mainstream households (non-retired, non-institutional population) derivative of an increase of 6,350 permanent primary jobs directly stimulated by an increase in annual crossborder truck traffic.

In an effort to be conservative, the substantial volume of construction employment (basically a one-time employment event) related to requirements for new facilities, not only in regard to the border crossing but also relative to housing for the induced population, etc., was not subjected to an economic multiplier. These jobs, though a substantial factor, are not a permanent result of the economic stimulus assumed to be derivative of the new Port of Entry facility. Projections of overall economic impact of the assumed increase in crossborder traffic are, therefore, conservative.

### **Income Implications**

The primary jobs stimulated by assumed increase in annual crossborder traffic (6,350 jobs) will be principally in transportation and warehousing and in trade-related activities. Both these categories of employment are typified by above-average income. An index of average income per employee by industry in the U.S. illustrates this relationship as follows:

Industry	Index of Annual Earnings Per Employee by Industry
Agriculture	0.55
Mining	1.47
Construction	1.02
Manufacturing	1.13
Transportation	1.10*
Communication	1.47
Utilities	1.50
Wholesale Trade	1.19*
Retail Trade	0.61
Finance, Insurance, and Real Estate	1.26
Services	0.94
Government and Related	1.07

\* New primary jobs will generally be in this sector.

Source: U.S. Bureau of Economic Analysis.

The secondary jobs (6,330 induced local jobs) will be lower paid because of the large component of retail and services employment implicit in this type of induced employment growth. The estimated impact on payrolls of the primary and secondary (induced) anticipated job growth is summarized below:

	Annual Income		
	Per Job	Per Household	Total
Primary Jobs	\$32,430	\$46,634	\$205,930,500
Induced Jobs	\$28,647	\$41,194	<u>\$181,335,500</u>
Total			\$387,266,000
Average Income:			
	Per Employee - \$30,541		
	Per Household - \$43,918		

Total increase in payrolls of nearly \$400.0 million a year provides economic support for a significant amount of new secondary or induced development.

Fairly conservative estimates of the average price of new owner-occupied housing compatible with the pay scales of the new employees (basically a 2.5 multiplier on average income) along with similarly conservative estimates of the supportable value of rental units (demand for which will be generated by the new employment) indicate that the 33,995 new residents that will eventually result from the direct and indirect

effects of the assumptions regarding increased levels of crossborder traffic support \$799,087,160 in new housing value at a ratio of 65.0 percent ownership and 35.0 percent rental occupancy.

Allowing for a fairly low assumed ambient vacancy rate, projected population and employment growth will support \$825.0 million of new residential construction.

Consumer expenditures of 8,818 to 9,200 new local households supportable by the cumulative economic impact of the assumed increase in annual crossborder traffic represents conservatively estimated potential for development of \$94.1 million of new retail facilities and \$33.0 million in other types of commercial real estate including medical facilities, offices, entertainment facilities, etc.

The \$952.0 million of new private sector development apart from the facilities directly related to the Port of Entry constitutes support for 16,414 job years of construction employment.

The expanded population base will also induce development of new public sector facilities for schools and related activities - an estimated \$22.1 million - represents 3,812 additional job years of construction employment.

Construction of new industrial and commercial facilities directly related to Port of Entry activities represents support for another 3,160 job years of construction employment - a total of primary and secondary construction employment coincident with the increase in crossborder traffic from the 1994 level of 176,825 crossings per year to 730,000 truck crossings per year of 23,386 job years of construction employment.

Independent estimating techniques define the amount of new retail floor area development likely to be induced by the expanded population base of between 1.2 and 1.34 million square feet. Another 400,450 square feet of nonresidential floor area will be developed for offices, theatres, bowling centers, churches, medical facilities, etc.

Projected increase in in-store taxable retail sales resulting from the projected increase in consumer population, as well as new inter-business retail activity base, ranges from \$175.0 to \$186.0 million a year in terms of 1994/95 prices.

### Summary

Expected growth in population in Imperial Valley due to the primary and secondary effects of the anticipated level of increase in crossborder truck traffic at the Calexico Port of Entry is 33,995 new residents and a total of 12,680 new jobs. Derivative effects of this increase in economic activity in terms of new housing development, construction of new retail and other commercial facilities, etc., is summarized below:

#### **Assumption:**

Increase in annual crossborder truck traffic from 176,825 a year in 1994 to 730,000 a year at the horizon planning date.

#### **Primary Impact:**

Demand for 4.26 million square feet of new industrial floor area, 245-310 acres of new industrial development.

Demand for development of 65 acres for new commercial facilities.

Increase employment of 6,350 jobs.

Increase annual payroll (1994 prices) of \$205,930,500

#### **Total Impact - Primary and Induced**

Employment (Permanent)	12,680 Jobs
Population	33,995

#### **Construction**

##### Primary:

Industrial	4.26 Million Sq. Ft.
Commercial	65.0 Acres

##### Secondary:

Housing Including Vacant	9,300-9,700 D.U.
Retail	1.10-1.34 Million Sq. Ft.
Other Commercial	0.4 Million Sq. Ft.

Increased In-Store Taxable Retail Sales	\$175-186 Million Per Year in 1994 Prices
---	---

Construction Employment	23,386 Job Years
-------------------------	------------------

It should be borne in mind that these projections deal only with the impact of increased crossborder truck traffic. Concurrently, continued expansion of Imperial Valley's retirement population will also contribute to economic growth as will increases in local jobs supported by nonlocal sources of revenue such as the prisons.

**APPENDIX A**  
**IMPERIAL VALLEY RETAIL SECTOR**

## APPENDIX A

### IMPERIAL VALLEY RETAIL SECTOR

Exhibit A-1 compares in-store taxable retail sales per capita population in Imperial County with comparable figures for Southern California in its entirety as well as the State of California. As would be expected in relationship to consumer income levels and the large households typical of Imperial County's population, expenditure levels are disproportionately low relative to population in the apparel sector, drug stores, liquor stores, restaurants, the furniture and appliance sector, the auto sector, service stations, and other retail stores. They are higher than typical in general merchandise stores - supported in part by crossborder consumer traffic.

Also shown in Exhibit A-1 is a comparison of taxable retail sales per establishment in Imperial County with comparable figures for Southern California and the State. In most instances except for liquor stores, merchants in Imperial County have lower average sale volume per establishment than typical of either Southern California as a whole or the State.

Exhibit A-2 compares actual taxable sales in Imperial County in 1994 with the level that would have been achieved had residents of Imperial County spent as much per capita in each category of merchandise as the average of all residents of the State of California. Taxable sales in general merchandise stores, food stores, and building materials and farm implements dealers were more than would be projected on the basis of the assumption of comparable average annual expenditures per capita. This difference primarily reflects support from Mexicali residents.

The history of in-store taxable retail sales in the County (expressed in constant dollars) included in Exhibit A-3 shows fairly consistent growth even after discounting for the impact of inflation. Part of this, however, is the result of increasing population.

The population effect can be controlled by comparing year-to-year sales relative to the County's population base. These calculations provided in Exhibit A-4 show a decrease in average per capita in-store taxable retail sales in Imperial County after 1990. This is almost certainly the result of the observation that much recent increase in population is related to inmates of local prisons who have no impact on in-store taxable retail sales in the Valley.

A comparable history of taxable retail sales per establishment in Imperial County is included in Exhibit A-5. In most cases, the number of establishments has increased faster than the available consumer expenditures (after allowance for inflation) which is indicative of a competitive local retail sector.
